1 How to Use This Document

This document is the second edition of the Keja AI partner proposals, rebuilt on fresh market research and a product that now demonstrably exists. It contains six concrete, researchable partnership tracks—each with named targets, a specific proposal, a clear ask and a commercial model. It is written to be carried into a meeting and answered in the room: every claim about the platform is verifiable at keja.app within ninety seconds.

Each track in Chapters 2 through 7 follows the same five-part structure: who the partners are, why Keja fits their strategy, the proposal in operational terms, the ask, and the commercial model. Chapter 8 consolidates the pilot scopes and sequences the outreach calendar. The consistent thesis across all six tracks: Keja does not ask partners to trust it—it asks partners to audit it. The claims register, the versioned Trust Score engine, the per-release audit manifest and the 538-test engineering gate are the credential. Partners gain a trust layer their competitors lack; Keja gains the supply, distribution and rails it cannot build alone.

6 partnership tracks	20+ named target organisations	90s to verify any claim at keja.app	0 payments before legal gates open

2 Mortgage Lenders and Housing Finance

Kenya's mortgage market is structurally shallow—roughly 3 percent of GDP, with only about one in nine Kenyans able to afford a standard mortgage—which means lenders compete fiercely for a thin pool of qualified borrowers. The Kenya Mortgage Refinance Company and the Treasury-backed Kenya Mortgage Guarantee Trust (capitalised with a further EUR 4 million commitment in September 2025) exist precisely to widen that pool. Lenders' binding constraint is qualified demand; Keja's verified inventory plus its affordability calculators are a qualified-demand machine.

Primary targets

Who they are. Kenya's retail mortgage writers: Equity Bank, KCB, NCBA, Housing Finance (HF Group), I&M Bank, Stanbic—the institutions that originate the majority of the country's ~27,000 active mortgage accounts—plus the Kenya Mortgage Refinance Company (KMRC) as the wholesale refinancing layer whose mandate is expanding primary-lender capacity.

Why Keja fits. Every Keja listing already carries the inputs a lender needs to pre-qualify interest: verified asking prices against area bands, rent-estimate evidence for buy-to-let underwriting, and an affordability

calculator (FACT/ESTIMATE-labelled) users run before they ever speak to a loan officer. Keja's diaspora users—sending home a record USD 5.08 billion in the year to June 2025—are exactly the non-resident applicants lenders find hardest to qualify and most want to reach.

The proposal. A co-branded 'Keja Verified' financing pathway: qualified buyers exit the Investment Calculator into a lender's pre-qualification flow, carrying their evidence pack (listing, area band, trust factors) with them. The lender gets pre-structured, pre-verified applications; the buyer gets a financing decision grounded in the same numbers they used to choose the property. Start as a referral and data-sharing pilot with one lender before any deeper integration.

The ask. One product owner and one pilot cohort: 8 weeks, 200 pre-qualified leads from Keja's calculator funnel, measured on application-completion and approval rates versus the lender's walk-in baseline.

Commercial model. Referral fee per completed mortgage at pilot; per-seat licensing of the evidence-pack API when the deeper integration lands. No platform fee on the buyer's side—Keja stays on the trust side of the transaction.

3 Law Firms and the Verification Desk

Title verification in Kenya is now digitally possible—Ardhisasa, the Ministry of Lands' official platform, lets parties verify ownership, run official searches and process transfers online—but it remains a registry, not a consumer product. The official search (Form RL26, KES 500–1,000 per search) is the authoritative step; everything around it—interpreting the result, chain-of-title review, encumbrance analysis, Powers of Attorney for absent buyers—is advocate work. Keja's verification desk needs exactly that capability as a service.

Primary targets

Who they are. Nairobi conveyancing practices with diaspora caseloads—the mid-size firms that already handle remote closings—plus the property arms of the large commercial firms. The right first partner is one firm with an existing Ardhisasa workflow and appetite for productised consumer conveyancing.

Why Keja fits. Keja's evidence panels are designed around the honesty principle that simulated checks are labelled simulated: the claims register openly states that no live Ardhisasa connection exists yet. That is the partnership. The platform supplies structured demand—buyers who arrive with a property chosen, evidence organised and questions prepared—and the firm supplies the authoritative title step and closing. The diaspora corridor multiplies this: Keja's PoA checklist and scheduling tools already walk a remote buyer through exactly the documents the advocate will need.

The proposal. A 'Keja Verification Desk' service tier: partner-firm advocates run official Ardhisasa searches and chain-of-title reviews for Keja listings, with results recorded into the evidence panel (scope,

method, check date—the panel's existing schema). Verified listings earn the title-check flip in the claims register—from simulated to live, in public, with the partner's name on the method line. Diaspora closings bundle into a fixed-price product: PoA, search, escrow-style holding instructions and completion report.

The ask. A named partner and a per-search rate card; a 12-week pilot covering 50 official searches on the curated inventory, plus a fixed-fee diaspora closing product priced and listed on the platform.

Commercial model. Keja collects the consumer fee; the firm bills the search and closing work at agreed rates. Revenue splits on bundled products; the register flip itself is not for sale—it happens only when the evidence genuinely exists.

4 Property Developers

Nairobi's sale prices rose roughly 8.2 percent year-on-year, led by detached homes and suburban land, while the luxury apartment segment—Kilimani included—sits in oversupply with compressed yields and high vacancy. Developers in that market are squeezed between buyers who demand evidence and marketing channels that cannot provide it. Off-plan selling survives on trust; Keja is a trust product with a Developer Console already built.

Primary targets

Who they are. Mid-size Nairobi residential developers (the 30–300 unit segment) with off-plan or newly-completed stock in oversupplied areas—the firms for whom differentiated, evidence-backed marketing is now existential—plus land-assembly specialists in the suburban growth corridors where prices are rising fastest.

Why Keja fits. The Developer Console gives them screening-grade feasibility (units, GFA, cost stack, GDV, margin, absorption, sensitivity grid), month-by-month cashflow with interest drawdown, and land-banking shields derived from live marketplace comps—all unit-tested, all labelled ESTIMATE. Keja listings give their finished stock what no portal offers: a Trust Score with published factors, an Investment Score with honest confidence bands, and completion-date plus payment-plan fields designed for off-plan disclosure.

The proposal. A 'Verified Launch' package: the developer's inventory on Keja with full evidence panels, the firm's feasibility model run in the Console under NDA, and co-branded Passport Cards for their sales team—every unit marketed with the same labelled trust factors. In oversupplied areas, 'the listing you can audit' is a category-killer pitch.

The ask. Two pilot developers, one oversupplied-submarket launch each, 10 weeks, measured on enquiry quality (viewings requested per 1,000 impressions) versus their existing portal spend.

Commercial model. Launch-package fee plus per-listing verification services; the Console converts to the KEJA PRO enterprise tier once usage sticks.

5 Diaspora Organisations and Remittance Partners

The UK, US and UAE corridors dominate Kenya's remittance inflows—a record USD 5.08 billion in the twelve months to June 2025, with the Central Bank projecting around USD 5.24 billion for 2026—and real estate is consistently among the top intended uses. Diaspora associations, professional bodies, churches' welfare networks and the remittance companies themselves aggregate exactly this audience, and they hear the same story every December: money sent home for a house that was never built, sold to someone else, or encumbered by a relative's loan.

Primary targets

Who they are. Kenyan diaspora associations and professional chapters in the UK (Kenya Community in the UK, professional societies), the US (state-level Kenyan associations, harambee networks) and the UAE; plus the remittance specialists serving those corridors—WorldRemit, Sendwave, Wise and M-Pesa Global—for whom property is the stickiest use case and the highest-value transfers.

Why Keja fits. The Diaspora Hub is purpose-built corridor tooling that no remitter or association offers: timezone-accurate viewing scheduling with cross-day warnings, the PoA checklist, remittance cost comparison across bank, specialist and stablecoin models, and journey tracking from search to completion. Keja's trust spine answers the fear the associations hear every Christmas: every listing's evidence is inspectable from abroad, and reports from the diaspora enter the same adjudication queue as everyone else's.

The proposal. A co-marketed 'Build Home Safely' programme: Keja provides the Hub, the evidence system and monthly live walkthrough webinars; the association provides community trust and reach; the remittance partner provides a transparent cost comparator integration and event presence. Members get a verified pathway from dollars in London to a titled, evidenced property in Nairobi.

The ask. Three associations (one per corridor) for a 90-day programme with a named coordinator each; one remittance partner signed to the comparison integration with an honest-label agreement (ESTIMATE band until live rates are contractually available).

Commercial model. Free for associations and members during the pilot—Keja's take is corridor depth and feedback. The remittance integration carries a referral arrangement only when it flips to live rates; until then the comparator stays honestly labelled as typical models.

6 Portals and Data Partners

BuyRentKenya—East Africa's most-trafficked dedicated property portal, backed by ROAM Group—together with Jiji and Property24 Kenya defines the attention layer of the market. Their structural problem, as Chapter 3 of the strategy document argues, is that listing volume is their product and verification cuts volume. Keja's proposal inverts the threat: the trust layer as an embeddable service that makes their inventory more transactable, not smaller.

Primary targets

Who they are. BuyRentKenya (ROAM Group) and Jiji Kenya as the volume portals; Property24 Kenya as the listings-syndication case; institutional data buyers (insurers, researchers, lenders' risk teams) as the second audience for the same API.

Why Keja fits. Keja's Auto-Pilot pipeline already ingests, deduplicates and anomaly-screens external feeds—it was built for exactly this integration—and the trust anchor makes every published score auditable after the fact. A portal that embeds Keja scores gains the trust story it cannot build without offending its listing customers; it can adopt verification incrementally, listing by listing, exactly as the register's per-claim status permits.

The proposal. A syndication-and-scoring pilot: the portal feeds a bounded subcategory (say, 500 Nairobi apartment listings) through Keja's ingest pipeline; Keja returns labelled trust factors, price-band positions and duplicate flags; the portal displays what it chooses with Keja's evidence links. Measure engagement lift on scored versus unscored listings. The data-buyer track runs the same API in the other direction: honest, anchored market data for risk and research desks.

The ask. One portal, one subcategory, 8 weeks, engagement-measured—scored listings versus control at matched impressions. In parallel, one institutional data pilot with a research or insurance desk.

Commercial model. Per-call API pricing on the scoring service; syndication earns the portal better engagement at zero cost during pilot. Data licences priced per seat for institutional desks.

7 Regulators, Registry and the Capital-Markets Path

The Capital Markets Authority regulates REITs (Income, Development and Islamic structures alike) and, as of September 2025, has admitted real-estate tokenization projects into its regulatory sandbox. The Ministry of Lands' Ardhisasa platform is the authoritative registry. These institutions are not customers; they are the rails Keja's Phase 4 depends on, and the correct posture is early, documented engagement built on the platform's existing structural guarantees.

Engagement targets

Who they are. The Capital Markets Authority's sandbox and innovation functions; the Ministry of Lands' Ardhisasa programme office; the Central Bank of Kenya's payments supervision for the eventual PSP partnership; and, at Phase 4, licensed REIT managers and trustees as co-sponsors of any tokenization offering.

Why Keja fits. Keja's regulatory posture is already structural: the code prevents payments, tokenization, KYC or M-Pesa escrow claims from flipping live without a committed legal-approval artifact—the gate is in the build, not in a policy PDF. The claims register gives a regulator a live, public map of exactly what the platform does and does not do. That is the pitch: audit us and you already know what you will find.

The proposal. A structured pre-application dialogue: present the register, the trust anchor, the regulatory gates and the honest-state document; agree the evidence the sandbox application will need (verification desk SLAs, advocate-network search references, PSP partnership terms); and sequence Ardhisasa access through the verification-desk partnership rather than around it. No application is filed before Phase 2's real-supply exit criteria are met—the regulator sees a company that arrives when it says it will.

The ask. Named engagement contacts and a written pre-application meeting with CMA's innovation function within the Phase 2 window; Ardhisasa access terms explored through the Chapter 3 law-firm partnership.

Commercial model. No commercial model with regulators—the deliverable is a documented path to the Phase 4 sandbox application, with Keja funding its own compliance work from PRO and desk revenue.

8 Pilot Grid and Ninety-Day Outreach Calendar

Six tracks, one calendar. The table below consolidates every pilot into a single ninety-day execution grid, sequenced so that supply and trust partnerships (law firms, developers) land before distribution and capital ones (lenders, diaspora, portals) scale them, and regulatory engagement runs continuously as the documented backdrop.

Weeks	Lenders	Law firms	Developers	Diaspora	Portals	Regulators
1–2	Target list + one-pagers	Shortlist 5 firms	Target 8 firms	Brief 3 associations	Open intro with ROAM	Pre-application letter
3–4	First lender meeting	First partner meeting	Console demos	Webinar #1	Scope memo	CMA intro meeting
5–8	Pilot cohort (200 leads)	50-search pilot	2 launches live	Corridor programme live	500-listing scoring pilot	Ardhisasa via law firm
9–12	Measure + renew	Register flip: title-check	Case studies	Remitter integration	Engagement report	Sandbox criteria agreed

Table 8.1 — The consolidated ninety-day partnership grid. Each cell is a deliverable with an owner.

The calendar's rule mirrors the product's: no track advances on claimed interest—only on the named commitment in the prior cell. And the document's closing rule mirrors the register's: any partner who cannot verify a claim in this document at [keja.app](#) should decline the meeting, because the entire proposal rests on being the platform that survives its own audit.

Keja does not ask partners to trust it. It asks partners to audit it—and then to build on what they find.
