1 The Market, In Numbers

This is the second edition of the Keja AI marketing playbook, rewritten for one reason: the product now demonstrably exists, and every claim in these pages is anchored to a screen you can open today at keja.app. Marketing a trust product means the marketing itself must be trustworthy—so this playbook cites only verifiable market data, shows the real interface, and treats the platform's honest trial-status disclosure as a strength to be communicated, not a caveat to be hidden.

Kenya's property market is large, urbanising and chronically opaque—the three conditions that make a trust layer valuable. The Central Bank of Kenya counted KES 674 billion (about USD 5 billion) in diaspora remittances in 2024, a 14 percent rise on the prior year, and projects roughly USD 5.24 billion for 2026; the twelve months to June 2025 alone set a record at USD 5.08 billion. Real estate is consistently among the top intended uses of that money, and distance multiplies every verification problem the money is meant to solve. On the supply side, sale prices in Nairobi rose about 8.2 percent year-on-year, led by detached homes and suburban land, while the luxury apartment segment in areas like Kilimani sits in oversupply with compressed yields—buyers there need exactly the price evidence and area intelligence Keja publishes. And the structural deficit is unchanged: a housing shortfall above two million units, urbanisation near 4.4 percent a year, and a mortgage market so shallow (roughly 3 percent of GDP) that only about one in nine Kenyans can realistically service a mortgage. Cash-and-trust, not credit, is how this market actually transacts.

The competitive set has not moved. Listing portals—BuyRentKenya (East Africa's most-trafficked dedicated property portal, backed by ROAM Group), Jiji, Property24—monetise attention and leave trust to the buyer. Agency and data houses (Hass Consult, Knight Frank) publish respected indices and serve institutional clients at institutional prices. The informal channel—brokers, word of mouth, family—still moves most volume with zero tooling. Nobody owns the trust layer across all three. That is the gap this playbook attacks: not more listings, but listings you can act on.

2 The Product, Proven

The strongest marketing asset Keja has is the product itself. This chapter is the evidence base: the live interface, photographed from the production site, with the claims register—the platform's public honesty contract—quoted exactly as users see it. Every screenshot below was captured from keja.app in September 2026.

Keja AI is a nine-product ecosystem on one installable app: Discover, Verify (Trust Score and evidence panels), Ask Keja AI (a deterministic, honesty-labelled advisory engine), the Deal Analyst, the Investment Calculator suite, Finance centre, Keja Tokenize (a clearly-labelled simulation), Landlord Studio and Tenant Hub, and the diaspora corridor tools. The marketing story writes itself when the product does the demonstrating—so the first rule of this playbook is that demo content must come from the real interface, never from stock imagery.

Figure 2.1 — The live homepage at keja.app: “Discover. Verify. Analyse. Finance. Invest. Transact. Manage.” One intelligent ecosystem.

Natural-language search is the product's most quotable capability, and it is live: the parser behind it is covered by unit tests, and the claims register says so. Marketing demonstrations should always use the platform's own advertised example—“2BR Kilimani under 15M”—because it is the query reviewers will try first when they check the claims.

Figure 2.2 — Natural-language search in production: “2BR Kilimani under 15M” parsed into structured filters, with Trust Scores surfaced on every card.

Every listing carries two zero-to-ten dials—the Trust Score and the Investment Score—each computed by a versioned, deterministic engine whose factors carry FACT, ESTIMATE and ASSUMPTION labels. When an area has thin comparable data, the platform says so instead of inventing decimal precision. This honesty system is the differentiator every other portal lacks, and it is the spine of all messaging.

Figure 2.3 — A live listing: the Trust Score breakdown with labelled factors, alongside price, area intelligence and the Investment Score.

The register is the machine-readable answer: every capability claim the product makes is declared with a status, an evidence pointer, and the date it was last reviewed. The public site can never silently drift from this list without a code change that reviewers can see.—Keja AI claims register, Trust Center

Ask Keja AI is the third screenshot every campaign should carry. It answers property questions with citations and epistemic labels, and it escalates legal, tax, valuation and suitability questions to humans instead of guessing. In a market where the alternative is a WhatsApp forward from a cousin, a labelled, traceable answer is a category of one.

Figure 2.4 — Ask Keja AI answering a live investment question with labelled guidance and follow-up actions.

3 Positioning and Message Architecture

Positioning is a decision about which fight to pick. Keja does not fight portals for listing volume; it fights the market's trust deficit. The one-line position: “Keja AI is Africa's real-estate trust and intelligence layer—every listing carries evidence, every number carries its label, every question gets an honest answer.”

Pillar	Message	Proof to show
Trust you can see	“Every listing carries a Trust Score you can open, question and challenge—twelve labelled factors, published weights, no black box.”	Trust dial screenshot; Trust Center; claims register

Pillar	Message	Proof to show
Numbers that admit what they are	“FACT, ESTIMATE, ASSUMPTION—every figure says which. Thin data shows the band, not a false decimal.”	Investment Score factors; thin-data confidence chips
Answers, not guesses	“Ask in plain English or Kiswahili; get a cited, deterministic answer that escalates legal questions to humans.”	Ask Keja AI transcript; escalation copy
Built for how Kenya transacts	“Works on low-end Android, installs as an app, WhatsApp-first sharing, offline-capable.”	PWA install flow; WhatsApp float; Property Passport share cards

Table 3.1 — Message architecture: four pillars, each anchored to a live proof surface.

Tone of voice follows the product's own register: confident, plain-spoken, evidence-first, never breathless. Kenyan English with Kiswahili where it lands naturally—“keja” is already the word for home. The trial-platform disclosure is stated once, plainly, in every asset: demo inventory, real engineering. That sentence converts skeptics precisely because competitors cannot say it.

4 Audiences and Personas

Seven segments, three of which are launch-critical. Each persona below is paired with the exact product surface that converts it and the channel where it is reachable—so every campaign maps a real person to a real screen.

Persona	Pain	Keja surface	Channel
First-time Nairobi buyer	Fears fake titles, price gouging	Trust Score + evidence panel + Deal Analyst	WhatsApp, TikTok, radio
Upgrading family	Needs school-run math, not hype	Area guides + Investment Calculator	Search, Facebook, school networks
Diaspora buyer (UK/US/UAE)	Cannot view, verify or close at distance	Diaspora Hub: scheduling, PoA, remit math	Diaspora orgs, YouTube, WhatsApp
Renting professional	Ghost listings, opaque deposits	Tenant Hub + verified rentals	Instagram, WhatsApp, workplace
Landlord / small portfolio	Arrears, statements, vacancies	Landlord Studio	WhatsApp business groups, radio
Agent / broker	Wants credibility and leads	KEJA PRO: CMA, listing writer, CRM	Direct outreach, associations
Developer	Needs pre-sale evidence and feasibility	Developer Console + off-plan listings	Direct, industry events

Table 4.1 — Seven personas, their pain, the converting surface, and the channel.

The launch-critical three are the first-time buyer, the diaspora buyer and the agent. The first-time buyer supplies volume and word-of-mouth; the diaspora supplies intent and dollar budgets; agents supply inventory and credibility. The other four segments are harvest-ready but should not fragment the launch calendar, which is why they appear only in the always-on channel plan.

5 Channel Plan

Channels are chosen for cost-per-trust, not cost-per-impression. Kenya's default communication rail is WhatsApp; the plan treats it as the primary distribution network, with search-engine-optimised content pages as the compounding asset and paid media as the accelerant that is only switched on after the funnel proves itself.

WhatsApp-first distribution

Every Property Passport, Trust Score breakdown and Ask Keja transcript is shareable as a link that opens correctly on a low-end Android browser—and the platform ships a WhatsApp deep-link float on every page. The playbook's first campaign is a set of ten shareable “Passport Cards”—one image, one Trust Score, one QR link to the live evidence page—designed to be forwarded in the family groups where property decisions actually happen. Distribution cost: the craft of making them worth forwarding.

Search and the content moat

The site pre-renders over one hundred static pages—listing passports, area guides, insights articles—precisely so search engines can index them. The content calendar in Chapter 6 feeds this: every insight article targets a question a real buyer types (“how to verify a title deed in Kenya”, “Kilimani vs Kileleshwa for investment”), and every article ends at a live product surface. SEO is the only channel whose cost falls as its output accumulates.

Paid media, gated on evidence

A modest paid layer—boosted WhatsApp cards, targeted search ads on verification-intent keywords, and short-form video of the product in use—is budgeted but gated: it switches on only when organic funnel data establishes a repeatable cost-per-install. Until then the budget sits in content and partnerships, which compound.

6 The Ninety-Day Launch Calendar

The calendar is sequenced so that every phase ends with a measurable gate, and no phase starts until the previous gate has been met. Ninety days, three phases, each with its own definition of done.

Phase	Focus	Ships	Gate to pass
Days 1–30 Seed	Content engine + WhatsApp cards + onboarding polish	10 Passport Cards; 6 insight articles; founder video walkthrough of the Trust Score; press one-pager	200 organic sessions/day; 3% of visitors open a Trust Score panel
Days 31–60 Proof	Diaspora corridor + agent outreach	UK/US corridor campaign; 25 agent onboarding calls; first 10 PRO workspaces; demo events	50 saved searches; 10 agents actively listing; CAC on paid test $\leq$ KES 150
Days 61–90 Scale	Paid amplification + partnerships	Paid layer on; partner co-marketing (see proposals document); radio segment; case studies	1,000 weekly actives; 30% week-4 retention; NPS $\geq$ 40

Table 6.1 — Ninety days, three gates. No phase begins until the prior gate is met.

7 Metrics That Matter

A trust product must measure trust, not just traffic. The metric tree pairs every growth number with the honesty number that keeps it credible.

Layer	Metric	Target (90 days)	Guardrail
Acquisition	Organic sessions/day	1,000	Bounce $<$ 55%
Engagement	Trust Score panels opened	30% of listing views	—
Engagement	Ask Keja questions/session	$\geq$ 2	Escalation rate healthy (5–15%)
Retention	Week-4 return	30%	Notification opt-in $\geq$ 40%
Trust	Issues reported per 100 listings	tracked, published	Response SLA 48h
Supply	Active agent workspaces	25	Zero fabricated-verification incidents

Table 7.1 — Growth metrics paired with trust guardrails. Publishing the trust metrics is itself a marketing act.

8 Creative Assets

The asset library exists to keep every touchpoint on-register: one film, one founder video, ten cards, one press kit. All product imagery comes from the live site—the screenshots in Chapter 2 are the source of truth and the brand's only permitted “stock”.

- **The launch film (75–90 s).** Built entirely from real product screens—the natural-language search answering “2BR Kilimani under 15M”, the Trust Score opening, the evidence panel, Ask Keja answering a question. Voiceover in plain Kenyan English; music licensed; end-card on the [keja.app](#) URL.
- **Founder video (3 min).** Unscripted walkthrough of one listing's evidence panel, ending on the claims register. Trust products are sold by faces, not logo animations.
- **Ten Passport Cards.** Static, WhatsApp-forwardable, each ending in a QR to the live evidence page.
- **Press kit.** The platform review PDF, three screenshots, the claims register as a one-pager, and the founder bio.
- **Radio script (60 s).** One pain (fake listings), one promise (evidence you can open), one URL.

9 The Honest Edge

Most marketing playbooks end with a budget. This one ends with the discipline that makes the budget work: never claim what the register cannot back. The trial platform says so plainly, and so does every asset.

Every competitor can buy billboards. None of them can publish a claims register that says which of their features are live, which are simulated, and which are planned—because none of them have built the engineering honesty to survive it. That is Keja's defensible marketing position: the platform whose marketing is subject to the same audits as its product. When the campaign says “Trust you can open”, the register is what makes it true, and the ninety-day calendar is how Kenya finds out.

Demo inventory, real engineering. Say it once, plainly, in every asset—and let the evidence panels do the rest.
