# 1 Market Snapshot

Keja AI sells trust in a market famous for the absence of it. This playbook translates that positioning into segments, messages, channels and a 90-day launch calendar that a small team can actually execute. It assumes the product surface documented in the engineering dossier: nine products, verified listings with explainable Trust Scores, trilingual AI advisory, and an installable app that works on the low-end Android devices that dominate Kenya.

Kenya's property market is large, urbanising and chronically opaque. Nairobi alone absorbs the majority of formal housing demand while an estimated majority of urban land transactions still occur through informal channels with weak paper trails. Buying or renting typically means trusting a broker you met once, a title you cannot readily verify, and a price negotiated without data. The diaspora layer makes it harder still: Kenyans abroad send billions of dollars home every year—remittances have long been among the country's top foreign-exchange inflows—and real estate is consistently one of their top intended uses, yet distance multiplies every verification problem. These are structural facts, not marketing inventions, and every Keja AI message grows from one of them.

The competitive set splits into three groups. Listing portals (BuyRentKenya, Jiji, PigiaMe) monetise attention and leave trust to the buyer. Agency and data houses (Hass Consult, Knight Frank) publish indices and serve institutional clients at institutional prices. And the informal channel—brokers, word of mouth, family—moves most volume with zero tooling. Nobody currently owns the trust layer across all three. That is the gap this playbook attacks: not more listings, but listings you can act on.

| Audience truth                                                                    | Marketing consequence                                                             |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Trust is the #1 unmet need—buyers fear fake titles, ghost listings, price gouging | Lead every message with verification and evidence, never with listing counts      |
| Mobile-first, data-sensitive users on mid-range Android                           | The PWA install story and offline mode are features to advertise, not footnotes   |
| WhatsApp is the default communication rail                                        | Shareable Property Passports and WhatsApp-first support beat email funnels        |
| Diaspora has money and anxiety in equal measure                                   | Timezone-aware service, remote verification, and 'invest from anywhere' messaging |
| Swahili and English coexist; French reaches the region                            | Trilingual product is a differentiator worth saying out loud                      |

Table 1.1 — Five audience truths and what each one demands of the message.

## 2 Positioning and Value Proposition

Positioning statement: for every stakeholder in Kenyan real estate who is tired of guessing, Keja AI is the trust infrastructure that verifies properties, scores them transparently and guides the money—because a home is too expensive to buy on faith.

The core value proposition compresses into one sentence per audience. For buyers and tenants: every listing carries an explainable Trust Score and a Property Passport, so you can see what you are buying before you fall in love with it. For owners and landlords: verified listings earn attention and price discipline, and the management tools collect rent and chase arrears for you. For investors and the diaspora: analysis, yields and deal screening in one workspace, with documents processed on-device. For professionals: a verification and data layer your clients can audit. The through-line is always the same—evidence over promises—and it is enforceable because the product's own claims register keeps the company honest about what is live, pilot or planned.

*Brand line: Discover. Verify. Analyze. Finance. Invest. Transact. Manage. The tagline for consumers: 'See the truth before you buy.'*

Tone of voice: calm, evidence-led, quietly confident—the anti-hype property brand. We never say 'revolutionary', never use urgency countdowns, never promise returns. We show the Trust Score factors, the sample sizes behind every statistic, and the evidence panels. In a market where competitors shout, restraint reads as strength, and it is a tone the engineering can actually back.

## 3 Target Segments and Personas

Seven personas cover the revenue surface. Each is defined by a trigger moment, the Keja products that serve it, and the single message that converts.

| Persona                  | Trigger moment                             | Keja products            | Converting message                           |
|--------------------------|--------------------------------------------|--------------------------|----------------------------------------------|
| First-time buyer (28-38) | Saved a deposit; terrified of being conned | Home, Verify, Finance    | Know the title is clean before you visit     |
| Tenant (22-35)           | Moving to Nairobi; deposits at risk        | Home, Verify, Tenant Hub | Rent a home that actually exists             |
| Landlord (35-60)         | Arrears, empty units, agent mistrust       | Manage, Verify           | Rent collected, arrears chased, no surprises |
| Investor (30-55)         | Idle cash; yield opacity                   | Invest, Data, portfolio  | See the yield before the money moves         |

| Persona          | Trigger moment                           | Keja products                         | Converting message                                 |
|------------------|------------------------------------------|---------------------------------------|----------------------------------------------------|
| Diaspora (25-60) | Wants property back home; cannot inspect | Diaspora portal, Verify, Deal Analyst | Invest in Kenya from anywhere, verified            |
| Agent / broker   | Needs credible inventory and tools       | Pro workspace, listings               | Clients trust your listings because we verify them |
| Developer        | Selling off-plan into scepticism         | Developer portal, Verify              | A Development Score buyers can audit               |

Table 3.1 — Persona map: trigger, product fit, and the one message that lands.

## 4 Messaging Framework

Three message pillars, each backed by a product fact the claims register can defend. Every campaign, post and landing page maps to exactly one pillar.

- **Pillar 1—Proof.** 'Every property, verified.' Trust Scores from twelve labelled factors, Property Passports with ownership, title, encumbrance, rates and zoning status, evidence panels with 90-day freshness. The proof point: users can drill from any score to its factors.
- **Pillar 2—Clarity.** 'Numbers you can interrogate.' Investment Scores, yield answers from live inventory with sample sizes declared, mortgage eligibility against the CBK 33% rule, and a Deal Analyst that returns Proceed / Negotiate / Investigate / High-Risk instead of vibes.
- **Pillar 3—Reach.** 'Kenya's property app, in your pocket.' Installable on Android and iOS without an app store, works offline on poor connections, speaks English, Swahili and French—built for how Kenya actually gets online.

Message hierarchy by funnel stage: awareness creative leads with the emotional truth ('Would you buy a house you cannot verify?'), consideration content shows the product (Property Passport walkthroughs, Deal Analyst screen recordings), and conversion moments are friction-removals (install the app in one tap; ask the AI in Swahili). Proof assets—the claims register, the trust center, the methodology pages—sit one click below every claim so scepticism converts rather than bounces.

## 5 Channel Plan

Channels are chosen for Kenya's actual media behaviour: WhatsApp first, short video second, radio still surprisingly strong, and search that is increasingly voice and Swahili-adjacent. Owned channels outrank paid throughout the launch year.

| Channel           | Role                        | Cadence         | First-90-days tactics                                                           |
|-------------------|-----------------------------|-----------------|---------------------------------------------------------------------------------|
| WhatsApp          | Conversion + retention rail | Daily           | Property Passport share cards; broadcast lists by area; click-to-chat support   |
| TikTok / Reels    | Awareness with 22-35s       | 4-5x weekly     | 'Scam or legit?' series; Trust Score explainers in Swahili; agent myth-busting  |
| Instagram         | Proof + brand               | 3-4x weekly     | Passport carousel posts; area guides; diaspora storytelling                     |
| Search / SEO      | Compounding intent capture  | Weekly articles | Insights articles already in-product; target 'verify title Kenya' style queries |
| Radio + community | Older buyers + upcountry    | 2 slots monthly | Drive-time trust segments; partner with a conveyancing firm for credibility     |
| Agent network     | Supply + word of mouth      | Ongoing         | Free verified-listing tier for the first 100 partnering agents                  |
| Diaspora orgs     | High-value acquisition      | Monthly         | Webinars with Kenya Diaspora Alliance chapters; timezone-friendly sessions      |

Table 5.1 — Channel roles and launch-quarter tactics.

## 6 Ninety-Day Launch Calendar

Three phases, each with a single dominant metric. The calendar assumes keja.app is live on the canonical domain and the PWA install experience is verified on real devices—both were completed in the September 2026 engineering pass.

| Phase | Weeks | Focus                        | Key actions                                                                                                                                                       | North-star metric      |
|-------|-------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| Prove | 1-4   | Make the trust story visible | Publish methodology pages; ship 20 SEO articles from existing Insights content; seed the 'Scam or legit?' video series; onboarding offer for the first 100 agents | Verified-listing views |

| Phase    | Weeks | Focus                        | Key actions                                                                                                                                                                                                     | North-star metric             |
|----------|-------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| Convert  | 5-8   | Turn attention into installs | PWA install campaign with the offline angle; WhatsApp broadcast lists by neighbourhood; first radio slots; Deal Analyst demo days for investor groups                                                           | PWA installs / weekly actives |
| Compound | 9-12  | Loops and partners           | Saved-search alerts driving return visits; referral programme with waived verification fees; two bank or developer partnership pilots from the partner programme; begin PR with the claims register as the hook | Weekly returning users        |

Table 6.1 — Launch quarter: prove, convert, compound.

## 7 Growth Loops and Retention

Paid acquisition buys attention once; loops are what make a marketplace cheap to grow. Three loops, ranked by leverage.

- **The Passport loop.** Every property detail page renders a shareable Property Passport card built for WhatsApp. A buyer shares it with family or a lawyer; the recipient lands on a verified listing and discovers the trust layer for themselves. Sharing is the product doing the marketing.
- **The alert loop.** Saved searches and Auto-Pilot inventory growth pair naturally: new listings keep arriving (the pipeline runs every six hours), alerts bring users back, and return visits deepen saved searches further. Inventory growth is already automated—the marketing only has to switch the notifications on.
- **The professional loop.** Agents and landlords who list verified inventory get enquiries from better-qualified buyers; the enquiry quality attracts more professional supply; more verified supply is exactly what buyers came for. The free verification tier for early agents is the seed capital for this loop.

Retention mechanics follow the same honesty principle: onboarding shows the claims register rather than hiding it, the install prompt is dismissible for fourteen days rather than nagging, and emails or WhatsApp broadcasts carry one useful thing—a new verified listing in the user's saved area, a yield answer with its sample size—never pure hype. Churn analysis starts once product analytics instrumentation lands (a tracked item in the engineering risk register), so the first quarter measures behaviour through install counts, alert engagement and share-card click-throughs rather than vanity dashboards.

## 8 KPIs and Measurement

A small set of funnel metrics, each with a launch-quarter target that is ambitious but honest for a bootstrapped team. Targets assume the canonical domain is live and the partnership pipeline in the companion document has begun.

| Funnel stage   | Metric                        | 90-day target      | Measurement       |
|----------------|-------------------------------|--------------------|-------------------|
| Awareness      | Video views (TikTok/Reels)    | 250,000 cumulative | Channel analytics |
| Interest       | Verified-listing views        | 40,000             | On-site analytics |
| Consideration  | Trust Score detail opens      | 8,000              | On-site analytics |
| Acquisition    | PWA installs (Android + iOS)  | 3,000              | Install events    |
| Engagement     | Weekly returning users        | 15% of installs    | Analytics events  |
| Supply         | Partnering agents / landlords | 100                | Account records   |
| Revenue signal | Pro workspace signups         | 150                | Account records   |

Table 8.1 — Launch-quarter funnel targets.

Reporting rhythm is weekly and public inside the team: one page, the seven numbers above, and a written note on the single biggest blocker. Numbers that miss two weeks running trigger a channel or message change, not a target change—the discipline that keeps a small budget honest.

## 9 Budget Scenarios

Three operating scenarios for the launch quarter. All figures are planning ranges in Kenya shillings, excluding salaries, and assume founder-led execution with contractor support rather than a hired marketing team.

| Line                                | Lean (KSh/month) | Standard | Aggressive |
|-------------------------------------|------------------|----------|------------|
| Content production (video + design) | 40,000           | 120,000  | 300,000    |
| Paid social + search                | 25,000           | 100,000  | 350,000    |
| Radio + community events            | 0                | 60,000   | 180,000    |
| Tools (analytics, scheduling, CRM)  | 10,000           | 25,000   | 60,000     |
| Contingency                         | 10,000           | 30,000   | 80,000     |

| Line  | Lean (KSh/month) | Standard | Aggressive |
|-------|------------------|----------|------------|
| Total | 85,000           | 335,000  | 970,000    |

Table 9.1 — Monthly budget scenarios for the launch quarter.

The lean scenario is deliberately viable: the product's own surfaces—Property Passports, Insights articles, the claims register—carry most of the message, and organic WhatsApp distribution costs nothing but craft. The standard scenario adds consistent paid amplification and radio credibility. The aggressive scenario only makes sense once the funnel metrics from Chapter 8 show a repeatable cost-per-install, and it should be gated on that evidence rather than optimism.
