

KEJA.APP · OPERATOR'S EDITION

The Site *Guide*

Everything you need to run Keja AI in one sitting — live URLs, the Google account sign-in, two-factor with Google Authenticator, the admin console, app installs for Android & iOS, the deployment pipeline, and where every credential lives. Brief by design, complete by intent.

SECURITY

Every address that matters

Keja AI is a fully static, single-page platform — one codebase that serves the website, the installable app and the native shells. Four addresses cover everything you will ever need to operate it.

● **Live site**

<https://keja.app>

The product. Canonical origin for SEO, deep links and the PWA. Also answers on www.keja.app.

● **Source code**

github.com/gadda00/keja-ai

Everything ships from `main`. Deploys, listings autopilot and docs all run from this repo.

● **Vercel project**

keja-ai-rho.vercel.app

The Vercel deployment origin behind keja.app. Dashboard: vercel.com → project `keja-ai`.

● **Trust Center**

keja.app/#/trust

The live claims register — what is real, simulated or planned. The honesty contract of the platform.

Signing in

One door in: **Google Sign-In** — the only sign-in method. The demo accounts and email/password paths were retired on 11 September 2026: one identity provider, one trust path. Any Google account can sign in; the admin email below is the platform administrator.

ACCOUNT	TYPE	ROLE & USE
<code>torv54@gmail.com</code>	Google · allowlisted	Admin — full console: verification queue, reports, partners, audit trail
Any other Google account	Google · self-serve	User — investor dashboard, favourites, Keja Token trial
Agent workspace	Google · granted by admin	Agent — Chacadom Premier Properties tools (KEJA PRO)

Sessions last **12 hours**, or **30 days** with "remember me", refreshing on activity. Google verifies the identity (ID-token checks: issuer, audience, expiry, verified email) — Keja never sees your Google password. Sessions and 2FA enrolment live on the device only, in this static build.

Google Authenticator — two-factor, required for admins

Admin accounts verify a **6-digit code** from Google Authenticator (RFC 6238 TOTP) on every new session. First admin visit shows a one-time enrolment wizard: scan the QR with the app (or type the setup key), enter the code it shows, then **save the 8 single-use recovery codes**. Everyone else can switch 2FA on from `keja.app/#/account` → Preferences & security . Codes refresh every 30 seconds; ± 30 s clock drift is tolerated. Runbook:

`docs/GOOOGLE_AUTH_SETUP.md` .

03 · THE CONSOLE

The admin side

The console lives at `keja.app/#/admin` and opens only behind three walls: Google sign-in → the admin-role allowlist → a verified two-factor code. Everyone else hits a sign-in wall or an explicit 403.

● Verification queue

Approve, reject or flag incoming listing submissions with review notes and completeness scores.

● Listing reports

User-submitted fraud/quality reports with adjudication workflow — the trust system's intake desk.

● Partner applications

Agencies, developers, landlords, portals and diaspora agents applying to the network.

● Feed health

Connected data feeds — API, CSV, portal syndication, WhatsApp — with last-run status.

● **Audit trail**

Every sign-in, moderation action and settings change, timestamped, with severity levels.

● **Users, roles & settings**

Suspend or promote accounts across user / agent / admin — the RBAC control room.

Honest scope, stated plainly

On today's static build the gate is a UI gate — the console shows demo data that already ships in the browser bundle, and the 2FA secret lives on the enrolling device. No admin-only server data exists yet. The Phase-2 backend moves every check server-side; until then, treat the console as the operations rehearsal.

04 · THE APP

Install on Android & iOS

Keja installs as a full app from the browser — no store visit, ~10 seconds, works offline. The prompt appears automatically after a few seconds; the footer's "Install app" link opens it on demand.

1

Android — Chrome, Samsung Internet, Edge

Tap **Install app** on the Keja banner (or browser menu → "Add to Home screen" / "Install app"). Confirm — Keja appears in the app drawer with its own icon and splash.

2

iPhone & iPad — Safari only

Tap the **Share** button in Safari's toolbar → scroll to "**Add to Home Screen**" → tap **Add**. All 17 current iPhone/iPad splash screens are pre-baked, so the launch looks native.

3

What you get

Full-screen standalone window, home-screen icon (with maskable adaptive icons on Android), offline shell with cached pages, long-press app shortcuts — Properties, Ask Keja, Deal Analyst — and automatic updates with a one-tap reload prompt.

4

Native shells (optional, for stores)

The same build wraps in Capacitor for Google Play / App Store: `npm run mobile:android / mobile:ios` — see docs/MOBILE.md.

How keja.app stays live

Deployment is fully automated: push to `main` and the pipeline does the rest. Nothing manual stands between a commit and production.

1

Push to main

`github.com/gadda00/keja-ai` — any commit triggers "Deploy to Vercel (keja.app)".

2

Quality gates run

TypeScript strict typecheck → ESLint → 241 unit tests → static export with sitemap + service-worker version stamp. A red gate stops the deploy.

3

Vercel builds and serves

Prebuilt static deploy to the `keja-ai` project; `keja.app` and `www.keja.app` serve it globally on the CDN edge.

4

Smoke test + watchers

A post-deploy smoke test hits the live site; "Production check" then patrols hourly (manifest, service worker, headers), and Auto-Pilot refreshes listings every 6 hours.

Rollback in one minute

Vercel dashboard → project `keja-ai` → Deployments → open the last known-good deployment → menu → **Promote to Production**. No code changes required; the next push redeploys from source.

Security and credentials

Nothing sensitive ships inside the site — there are no passwords at all anymore (Google handles identity; 2FA secrets live only on each enrolling device). Real credentials live in exactly three places:

CREDENTIAL	WHERE IT LIVES	WHAT IT DOES
VERCEL_TOKEN	GitHub repo secret	Authenticates the deploy workflow to Vercel
Vercel account access	vercel.com login	Domain, env vars, deployments, rollback
GitHub account & PAT	github.com	Source control, Actions, releases

Rotate these two, now that the build works

A GitHub personal access token and a Vercel API token were shared during setup sessions. They served their purpose; storage in chat history is not custody. Rotate both — GitHub → Settings → Developer settings → Personal access tokens (revoke & regenerate), Vercel → Settings → Tokens (same). Then update the `VERCEL_TOKEN` GitHub secret once, and all future PAT-based pushes simply use the new value.

The site itself ships hardened defaults: a strict Content-Security-Policy with Google-Sign-In allowances, HSTS, X-Frame-Options DENY, nosniff, a locked-down Permissions-Policy, and valid `.well-known` app-association files for both platforms. The last Netlify chore: if the old Keja site still exists in the Netlify account, delete it (app.netlify.com → site → Settings → General → delete) — DNS already points at Vercel, this is purely hygiene.

07 · KEEPING HOUSE

The maintenance playbook

Day-two work is repo work. The commands assume the repo root after `bun install`.

WHEN YOU WANT TO...	DO THIS
Verify everything locally	<code>npm run typecheck && npm run lint && npm test</code> — the same gates CI runs
Change copy, prices, UI	Edit <code>src/</code> , push to main — the pipeline deploys it
Curate listings manually	<code>src/data/properties.ts</code> + images in <code>public/images/</code> (Auto-Pilot adds more every 6 h)
Regenerate PWA art	<code>node scripts/generate-pwa-assets.mjs</code> after changing the logo
Build store APKs	<code>npm run mobile:apk (debug)</code> — see <code>docs/MOBILE.md</code> for release signing
Read the deep manuals	<code>docs/</code> — deployment, mobile, strategy, marketing, partner proposals, and the ~100-page technical audit

Stuck? The fastest humans: **WhatsApp +254 108 611 387** (the same channel the site's floating button opens) or **info@chacadom.com**. Office: Westlands, Nairobi.
